

# Continuous Integration (CI)

David Afonso Dorta  
Adexe Sabina Pérez

## Index of the presentation

---

1. What is “Continuous Integration”
2. What is “Continuous Delivery”
3. Example setting a CI tool on a project
  - a. Travis
  - b. Codacy
  - c. Git hooks
4. Bibliography

1

# What is “Continuous Integration”

And why everybody talks about it

# But first...

What does **“Integration”** means?

The “**Integration**” process  
are all the required steps to  
**compile and test** a project.

“

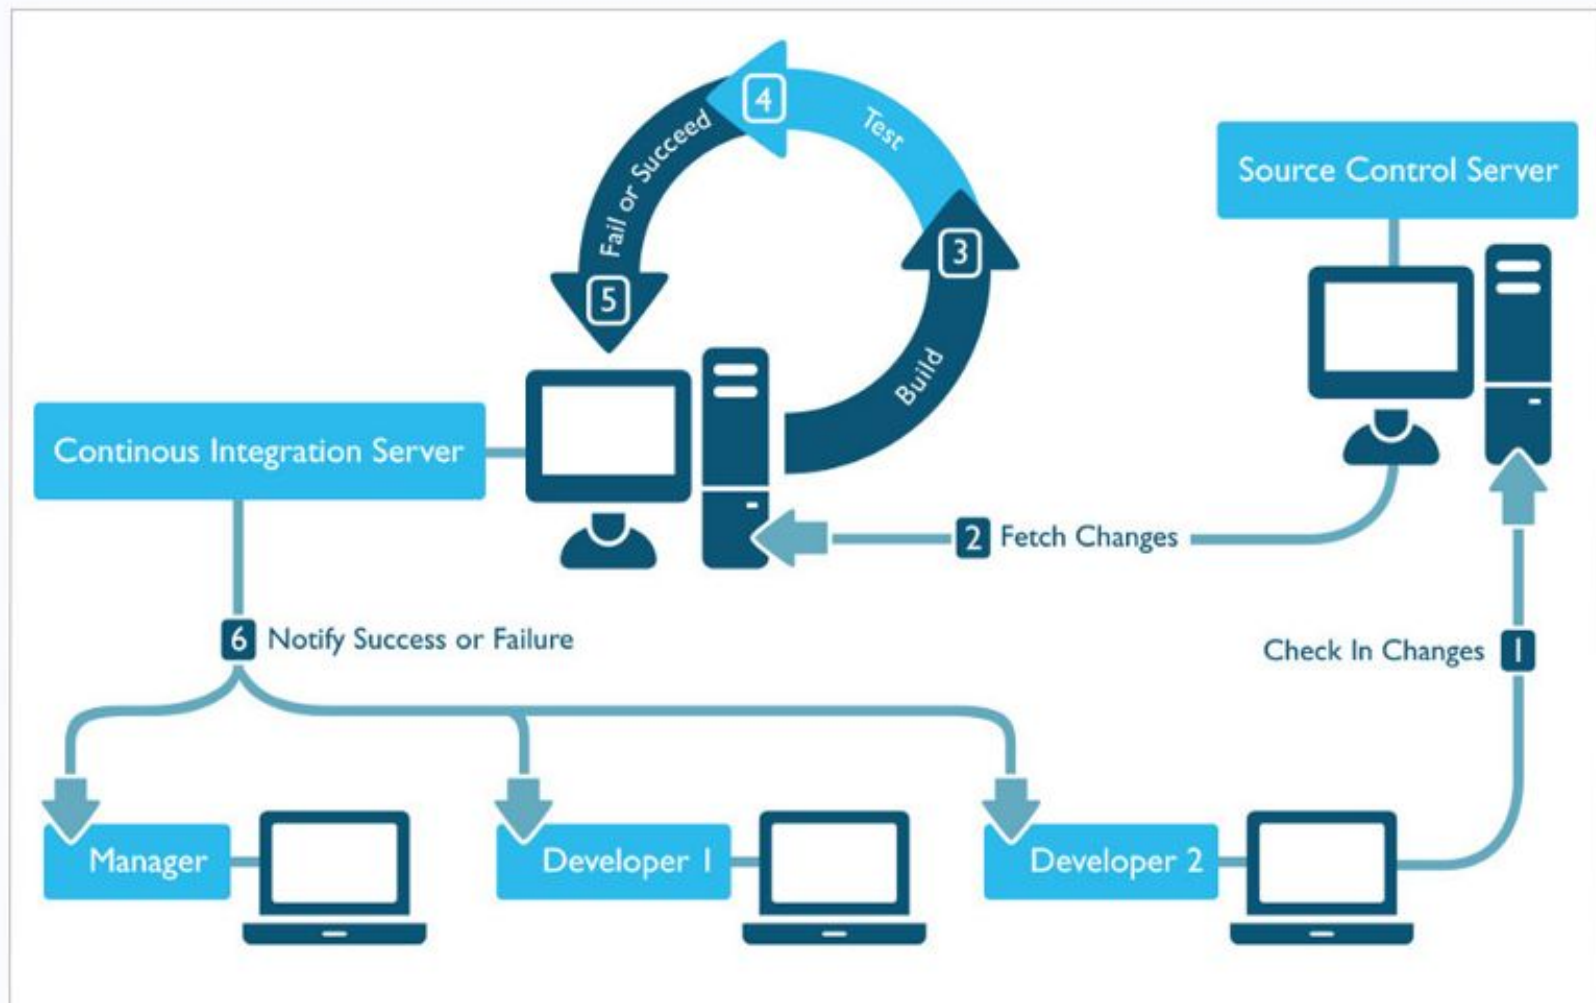

# Continuous Integration

The process of **Integration...** repeated over time.

(As easy as it sounds)

Method created by

**Martin Fowler**

British Software Engineering  
specialized in **OOP design, UML,**  
**patterns, agile development...**

# The idea

“The frequency of integration is **directly proportional** to the **easiness** of finding errors.”

# The idea

```
uppercase_sample = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'
lowercase_sample = 'abcdefghijklmnopqrstuvwxyz'
digit_sample = '0123456789'

if keras.backend.image_dim_ordering() != 'tf' and \
keras.backend.set_image_dim_ordering('tf') and \
print("INFO: '~/.keras/keras.json' sets 'image_dim_ordering' to 'th', temporarily setting to 'tf'")

# Create TF session and set as Keras backend session
sess = tf.Session()
keras.backend.set_session(sess)

# Get MNIST test data
X_train, Y_train, X_test, Y_test = data_mnist(train_data_dir=train_data_dir,
                                              validation_data_dir=validation_data_dir,
                                              test_data_dir=test_data_dir,
                                              shuffle=True)

assert Y_train.shape[1] == 10
```

**Compile &  
Test  
(Integrate)**

**300** lines of code

# The idea

```
uppercase_sample = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'
lowercase_sample = 'abcdefghijklmnopqrstuvwxyz'
digit_sample = '0123456789'
if keras.backend.image_dim_ordering() != 'tf':
    keras.backend.set_image_dim_ordering('tf')
print("INFO: '~/.keras/keras.json' sets 'image_dim_ordering' to 'th', temporarily setting to 'tf'")

# Create TF session and set as Keras backend
sess = tf.Session()
keras.backend.set_session(sess)

# Get MNIST test data
X_test, Y_test = data_mnist.load_data()

assert Y_test.shape[1] == 10
```

300 lines of code

**BAD PRACTICE**

Compile &  
Test  
(Integrate)

# The idea

```
uppercase_sample = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'
lowercase_sample = 'abcdefghijklmnopqrstuvwxyz'
digit_sample = '0123456789'

if keras.backend.image_dim_ordering() != 'tf':
    keras.backend.set_image_dim_ordering('tf')
    print("INFO: ~/keras/keras.json sets 'image_dim_ordering' to 'th', temporarily setting to 'tf'")

# Create TF session and set as Keras backend sess
sess = tf.Session()
keras.backend.set_session(sess)

# Get MNIST test data
X_train, Y_train, X_test, Y_test = data_mnist(tr
tr
te
te

assert Y_train.shape[1] == 10
```

Integrate

```
uppercase_sample = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'
lowercase_sample = 'abcdefghijklmnopqrstuvwxyz'
digit_sample = '0123456789'

if keras.backend.image_dim_ordering() != 'tf':
    keras.backend.set_image_dim_ordering('tf')
    print("INFO: ~/keras/keras.json sets 'image_dim_ordering' to 'th', temporarily setting to 'tf'")

# Create TF session and set as Keras backend sess
sess = tf.Session()
keras.backend.set_session(sess)

# Get MNIST test data
X_train, Y_train, X_test, Y_test = data_mnist(tr
tr
te
te

assert Y_train.shape[1] == 10
```

Integrate

50 lines of code

```
uppercase_sample = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'
lowercase_sample = 'abcdefghijklmnopqrstuvwxyz'
digit_sample = '0123456789'

if keras.backend.image_dim_ordering() != 'tf':
    keras.backend.set_image_dim_ordering('tf')
    print("INFO: ~/keras/keras.json sets 'image_dim_ordering' to 'th', temporarily setting to 'tf'")

# Create TF session and set as Keras backend sess
sess = tf.Session()
keras.backend.set_session(sess)

# Get MNIST test data
X_train, Y_train, X_test, Y_test = data_mnist(tr
tr
te
te

assert Y_train.shape[1] == 10
```

Integrate

```
uppercase_sample = 'ABCDEFGHIJKLMNOPQRSTUVWXYZ'
lowercase_sample = 'abcdefghijklmnopqrstuvwxyz'
digit_sample = '0123456789'

if keras.backend.image_dim_ordering() != 'tf':
    keras.backend.set_image_dim_ordering('tf')
    print("INFO: ~/keras/keras.json sets 'image_dim_ordering' to 'th', temporarily setting to 'tf'")

# Create TF session and set as Keras backend sess
sess = tf.Session()
keras.backend.set_session(sess)

# Get MNIST test data
X_train, Y_train, X_test, Y_test = data_mnist(tr
tr
te
te

assert Y_train.shape[1] == 10
```

## 30 lines of code

# CI can be tedious

Having to **constantly** perform the the integration of the build **manually** can **distract** a programmer from the actual work: *write code*.

Codeship

CI/CD

circleci

Buddy

**CI Automation Tools**

# Continuous Integration Keys

- **Automate** the build
- Make your build **self-testing**
- Every commit should build on an **integration machine**
- Test in a **clone** of the production environment
- Everyone can **see** what's happening

## Team responsibilities

- Check in **frequently**
- Don't check in **broken code**
- Don't check in **untested code**
- Don't check in **when the build is broken**
- **Don't go home** after checking in **until the system builds**

2

# What is “Continuous Delivery”

And how it further improves CI

The “**Delivery**” process  
describes a complete project  
lifecycle end-to-end.

“

**CI → Func. Test → Pre Production**

***Delivery***

***Continuous Delivery***

# The idea

**Continuous delivery** is a software engineering approach in which teams **produce** software **in short cycles**.

# CI is not just about testing

But also **improving** the quality of the **code** and making the life **easier** to the *programmer*.

3

## Configuring a project with CI tools, *from scratch*

Hands-on project

# Tools used

3.1

# Travis CI

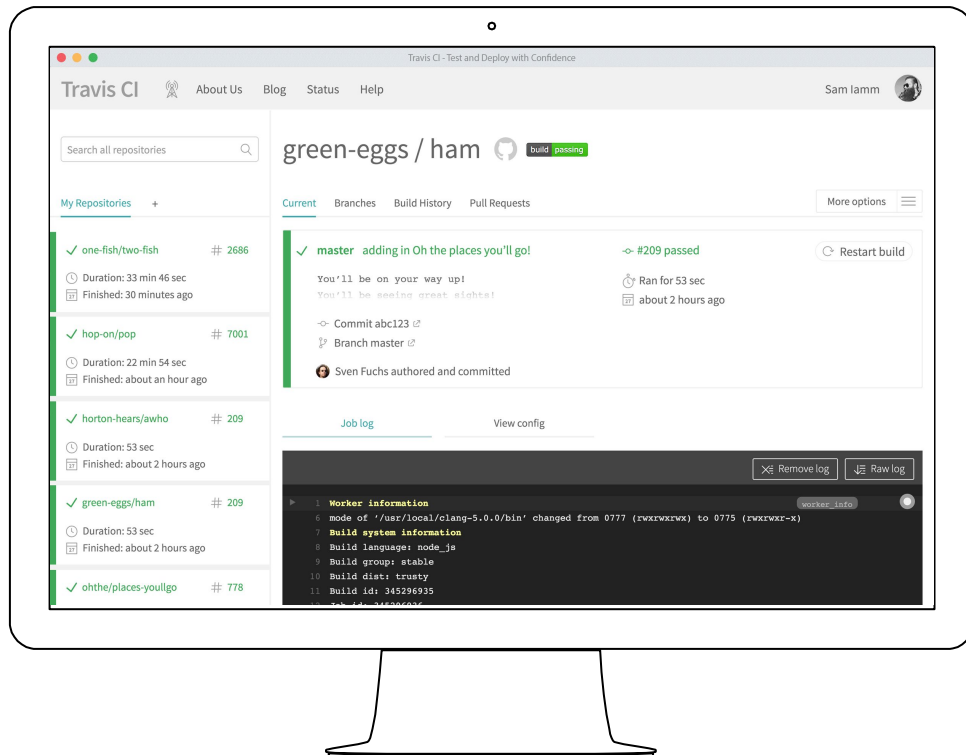

Continuous Integration and testing

# Travis CI

- Automated **test execution**
- Get reports on your **email**
- Check code against different **versions of the language**

# Configuring Travis CI

- Enable the repository on the **Travis CI web**
- Add a **.travis.yml** file to the repository
- Specify the **commands** used on the **integration** process

# Important!

- **Travis CI** is only compatible with Java projects that use **Ant**, **Maven** or **Gradle**.
- No **out-of-the-box** support for **Eclipse**.

3.1

# Codacy

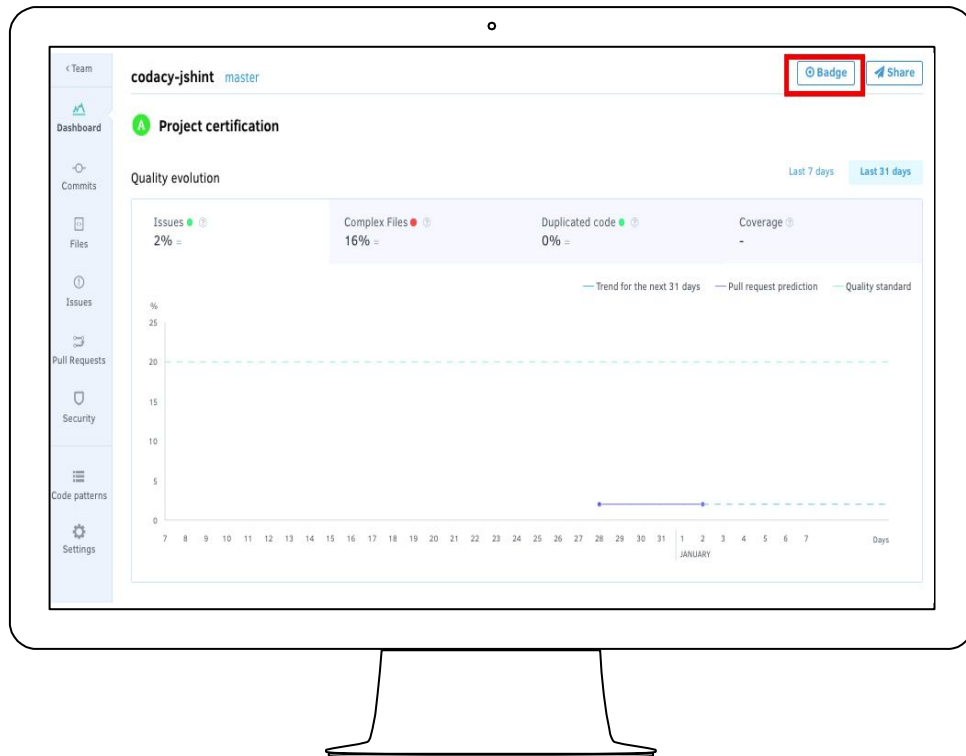

Code quality analysis

# Codacy

- Automated **code quality** report
- Get reports on the **evolution** of code quality
- Check code against popular **linters**

A “**Lint**er” is a tool that finds **syntax errors** or **style errors** on the code, returning a **report** to the user.

“

## Configuring Codacy

- Login on the Codacy web with your **Github account**
- Enable **Codacy** to access the repository

3.1

# Git hooks

Pre-commit automated tasks

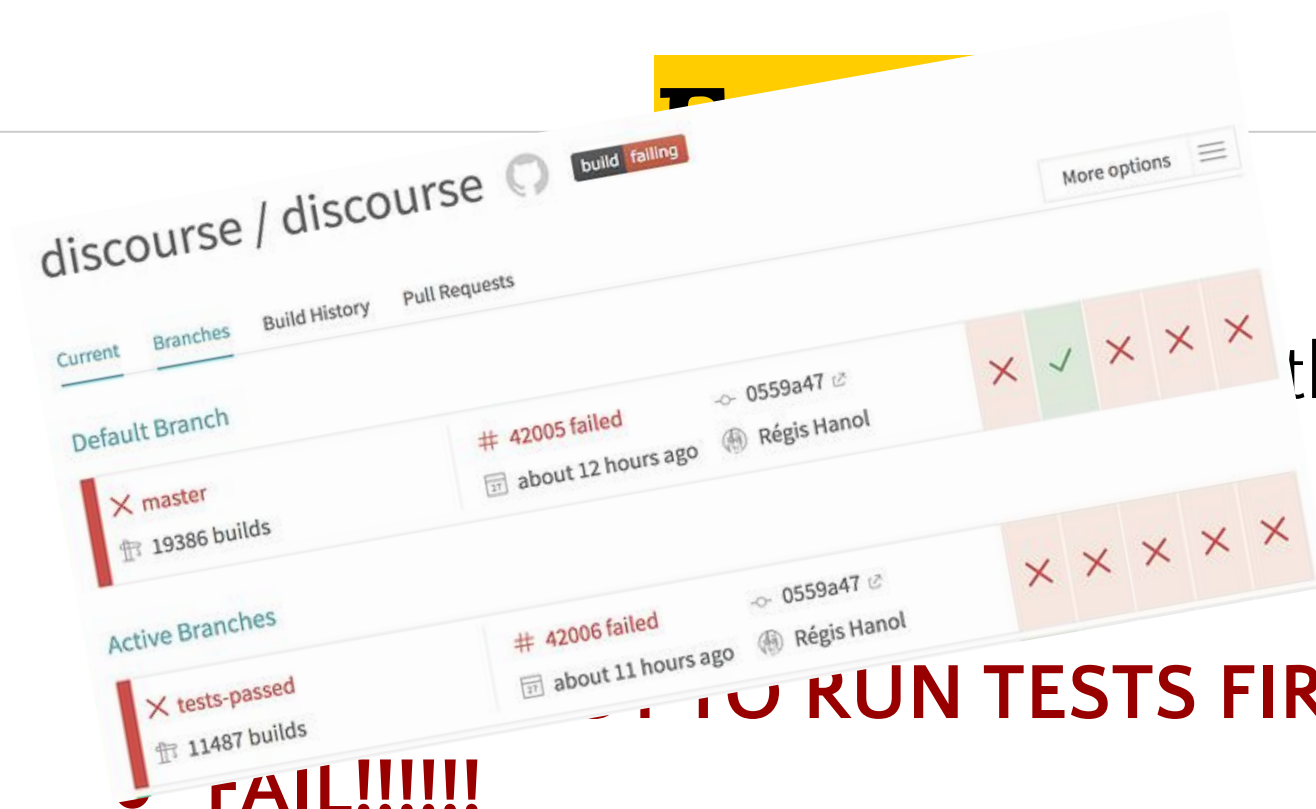

HOOKS

# Git hooks

- Automatic script execution with git
- Define **hooks** (scripts) that are executed before/after a git commit, pull, push, merge...

# Example

- Let's suppose we did a **push** to the **team repository**...
- **BUT FORGOT TO RUN THE TESTS FIRST!**
- **FAIL!!!!!!**

oh no...

the team

FAIL!!!!!!

TO RUN TESTS FIRST!

WHAT I'VE DONE WRONG

nted. Now  
and

OH NO

# Git hooks to the rescue

- We will configure a **git hook** that **runs tests automatically before a commit.**
- Won't let us push **unless all tests are passing.**

## Configuring Git hooks

- Create the **hook** and add it to the **.git/hooks** folder
- Add a **gradle task** to automatically **install** the hooks

# **Surprise exam!**

**kahoot.it**

# Thanks!

*Any questions ?*
